In-class Activity

In the N queens problem, your goal is to find a placement of N queens on an N -by- N chessboard so that no two queens can attack one another.

1. Is the following a valid placement of 4 queens on a 4x4 chessboard? Why or why not?

2. Draw all valid placements for $N = 4$. (you may not need every board)

3. What properties do you notice about valid placements?
4. Try to use those to come up with an algorithm to enumerate all possible valid placements for any N . (Ideally, a recursive algorithm!)
